WEIGHTED EXTRAPOLATION IN GRAND MORREY SPACES BEYOND THE MUCKENHOUPT RANGE

ALEXANDER MESKHI

Abstract. Rubio de Francia’s extrapolation in weighted grand Morrey spaces with weights beyond the Muckenhoupt range is established. Based on this result, the boundedness of maximal and Calderón-Zygmund operators, and commutators of singular integrals in weighted grand Morrey spaces for appropriate class of weights is obtained. The problems are studied for spaces and operators defined on quasi–metric measure spaces (spaces of homogeneous type) but the results are new even for particular cases of spaces of homogeneous type.

1. Introduction

Let $(X,d,\mu)$ be a quasi–metric measure space with quasi–metric $d$ and measure $\mu$ satisfying the condition: there are positive constants $c$ and $N$ such that for all $x \in X$ and $r \in (0,d_X)$ the following two-sided inequality holds: $\frac{1}{2}r^N \leq \mu(B(x,r)) \leq cr^N$, where $d_X$ denotes diameter of $X$, and $B(x,r)$ is the open ball in $X$ with center $x$ and radius $r$. The constant $N$ is called the dimension of $X$. In this case the measure $\mu$ satisfies the doubling condition: there is a positive constant $D_\mu$ such that for all $x \in X$, $r > 0$, the inequality $\mu(B(x,2r)) \leq D_\mu \mu(B(x,r))$ holds.

A quasi–metric measure space with doubling measure $\mu$ is called space of homogeneous type (SHT briefly). Examples of SHT are: (a) domains $\Omega$ in $\mathbb{R}^n$ satisfying the condition: $|B(x,r) \cap \Omega| \geq C r^n$, $x \in \Omega$, with positive constant $C$ independent of $x$, and $r$, where $|E|$ denotes Lebesgue measure of a set $E$; (b) rectifiable regular (Carleson) curves in $\mathbb{C}$ with Euclidean metric and arc-length measure; (c) nilpotent Lie groups with Haar measure (homogeneous groups), etc (see, e.g., [2, 18, 27] for the definition and properties of an SHT). Let $w$ be a weight on $X$, i.e., let $w$ be an integrable function on $X$. We denote by $L^p_w(X)$, $1 \leq s \leq \infty$, the weighted Lebesgue space with weight $w$ which is defined with respect to the norm $\|f\|_{L^p_w(X)} = \left( \int_X |f(x)|^p w(x) \mu(x) \right)^{1/p}$.

In [16] the weighted extrapolation in the weighted grand Morrey spaces $L^{p,r,\theta}_w(X)$ for $A_p(X)$ weights was derived, where $L^{p,r,\theta}_w(X)$ is the space defined by the norm:

$$\|f\|_{L^{p,r,\theta}_w(X)} := \sup_{0 < \epsilon < p - 1} \epsilon^\theta \|f\|_{L^{p-r,\epsilon}_w(X)} := \sup_{0 < \epsilon < p - 1} \epsilon^\theta \left( \frac{1}{B} \int_{B} \|f\|_{L^{p-r,\epsilon}_w(B)}^p \right)^{1/p},$$

where $1 < p < \infty$, $-1/p < r < 0$ and $\theta > 0$. In particular, it was shown that if the one-weight inequality $\|g\|_{L^{p,r,\epsilon}_w(X)} \leq C_0 \|g\|_{L^{p-r,\epsilon}_w(X)}$, $(f,g) \in \mathcal{F}$, holds for some family of pairs of non-negative functions $\mathcal{F}$, some $1 \leq p_0 < \infty$ and every $w \in Ap_0(X)$, where the positive constant $C_0$ is independent of pairs $(f,g)$ and $w$ and $\cdot \mapsto C(\cdot)$ is a non-decreasing mapping, then for all $1 < p < \infty$ and $w \in Ap(X)$, $\|g\|_{L^{p,r,\epsilon}_w(X)} \leq C_0 \|g\|_{L^{p-r,\epsilon}_w(X)}$, $(f,g) \in \mathcal{F}$.

The result of [16] was derived by using the ideas of [3], where the similar result in the classical weighted Morrey spaces was established (see also [25] for related topics). We refer to [12] for the weighted extrapolation in grand Lebesgue spaces.

Key words and phrases. Weighted extrapolation; Grand Morrey spaces; Weighted inequalities; Maximal functions; Singular integrals; Commutators of singular integrals.
Our aim is to study the similar problem for different grand weighted Morrey space $L^{p,\lambda,\theta}_{w}(\sigma, X)$. This space is defined on the base of the Morrey space $L^{p,\lambda}_{w}(X)$ and given by the norm
\[
\|f\|_{L^{p,\lambda,\theta}_{w}(\sigma, X)} := \sup_{0 < \varepsilon < \sigma} \epsilon^{\theta} \sup_{B} \left( \frac{1}{\mu(B)} \int_{B} |f(y)|^{p-\varepsilon} w(y) d\mu(y) \right)^{1/(p-\varepsilon)},
\]
where $0 \leq \lambda < 1$ and $\sigma$ is a small constant satisfying that $0 < \sigma \leq p - 1$.

If $\sigma = p - 1$, then we denote
\[
L^{p,\lambda,\theta}_{w}(p - 1, X) \equiv L^{p,\lambda,\theta}_{w}(X).
\]

This space for $w(\cdot) \equiv 1$, i.e. $L^{p,\lambda,\theta}_{w}(X)$, was introduced and studied in [19]. Later, in [24] the author introduced generalized grand Morrey space $L^{p,\lambda,\theta}_{w}(X)$ defined by the norm including the "grandification" taken not only with respect to $p$ but also for $\lambda$. Grand Morrey spaces $L^{p,\lambda,\theta}_{w}(X)$ are generalizations of grand Lebesgue spaces $L^{p,\lambda}_{w}(X)$ introduced in 1992 by T. Iwaniec and C. Sbordone [10] in their studies related with the integrability properties of the Jacobian in a bounded open set $\Omega$. A generalized version of them, $L^{p,\lambda,\theta}(\Omega)$, $\theta > 0$, appeared in L. Greco, T. Iwaniec and C. Sbordone [8], where the authors investigated the solvability of nonhomogeneous $n$-harmonic equation $\text{div}(A(x, \nabla u) = \mu$. Associate space to $L^{p,\lambda,\theta}$ is called small Lebesgue space (see [5]). Grand Lebesgue space is a Banach space which is non-separable and non-reflexive (see, e.g., [5]).

The space $L^{p,\lambda,\theta}_{w}(X)$ for $\lambda = 0$ is the weighted grand Lebesgue space $L^{p,\lambda,\theta}_{w}(X)$. In this space one–weight criteria under the $A_{p}$ condition on weights were derived in [6,11] and [20] for the Hardy–Littlewood maximal operator, Hilbert transform and fractional integrals, respectively (see also the monograph [13, Ch. 14] and references cited therein). The Rubio de Francia’s extrapolation result in $L^{p,\lambda,\theta}_{w}(X)$ space was proved in [12].

Weighted extrapolation for the classical weighted Morrey spaces $L^{p,\lambda}_{w}(\mathbb{R}^{n})$, $0 < \lambda < 1$, was established in [4] on Euclidean spaces.

Unlike $L^{p,\lambda}_{w}(X)$, the weighted Morrey space $L^{p,\lambda}_{w}(X)$ has the property that the operators of Harmonic Analysis are bounded in these space for weights beyond the Muckenhoupt range. In particular, in [26] the author proved the boundedness of the Hilbert transform in $L^{p,\lambda}_{|x|^{\alpha}}(\mathbb{R})$ for $0 \leq \lambda < 1$ and $\lambda - 1 < \alpha < \lambda + p - 1$. This range of values of $\alpha$ shows a shift with respect to the corresponding the $A_{p}(\mathbb{R})$ class which is $-1 < \alpha < p - 1$. The boundedness of the Hardy–Littlewood maximal operator $M$ in $L^{p,\lambda}_{|x|^{\alpha}}(\mathbb{R}^{n})$ for the sharp range $\lambda - n \leq \alpha < \lambda + n(p - 1)$. Later, the similar result was established in [22] for the Riesz transforms.

It is known that weighted grand Morrey spaces are Banach spaces (for further properties see, e.g., [14–16]).

Denote by $A_{p}(X)$, $1 < p < \infty$, the Muckenhoupt class of weights defined on $X$, i.e., this is the class of all integrable on $X$ functions such that
\[
[w]_{A_{p}} := \sup_{B} \left( \frac{1}{\mu(B)} \int_{B} w(x) d\mu(x) \right) \left( \frac{1}{\mu(B)} \int_{B} w^{1-p'}(x) d\mu(x) \right)^{p-1} < \infty,
\]
where $p' = \frac{p}{p - 1}$.

Further, a weight $w$ belongs to $A_{1}(X)$ if $(Mw)(x) \leq Cw(x)$ a.e., where $Mw(x)$ is the maximal function of $w$ given by the formula:
\[
(Mw)(x) = \sup_{B \ni x} \frac{1}{\mu(B)} \int_{B} w(y) d\mu(y).
\]
The weight function $d(x_0, x)^{\alpha}$ belongs to $A_{p}(X)$ if and only if $-N < \alpha < N(p - 1)$, where $N$ is a dimension of $X$ (see e.g., [7, Ch. 7] for Euclidean space but the proof for an SHT is the same). Further, the class $RH_{\eta}$ is a collection of weights for which the reverse Hölder’s inequality holds, i.e., there is a positive constant $C$ such that for all balls,
\[
\left( \frac{1}{\mu(B)} \int_{B} w^{\eta}(x) d\mu(x) \right)^{1/\eta} \leq \frac{C}{\mu(B)} \int_{B} w(x) d\mu(x).
\]
It can be checked that (see also [27]) that if \( s > r \), then \( RH_s \subset RH_r \), and that \( \bigcup_{1 < r < \infty} RH_r = \bigcup_{p > 1} A_p \).

It is known that the operators of Harmonic Analysis such as maximal and singular integral operators are bounded in the classical weighted Lebesgue space \( L^p_w \) under the Muckenhoupt’s \( A_p \) condition (see, e.g., [7, Ch. 7] for Euclidean spaces, [27] for an \( SHT \)). This property remains valid for the weighted Morrey space \( L^{p,r}_w, \ -1/p < r < 0 \) (see [17]).

Suppose that \( x_0 \) is a point in \( X \). Let \( w \) be a weight function on \( X \). Denote by \( w_\alpha \) the following function \( w_\alpha(x) := w(x) d(x_0, x)^\alpha \). We proved the extrapolation statement in the following form: if \( \|g\|_{L^p_w(X)} \leq C_0 \|f\|_{L^p_w(X)} \), \( (f, g) \in \mathcal{F} \), for some \( 1 \leq p_0 < \infty \) and every \( w \in A_{p_0}(X) \), with positive constant \( C_0 \) independent of \( (f, g) \) and depending on \( [w]_{A_p} \), then for all \( 1 < p < \infty \), \( \theta > 0 \), \( w \in A_p(X) \cap RH_\eta \), we have appropriate weighted inequality for the grand weighted Morrey space \( L^{p,\lambda,\theta}_w(X) \) with, generally speaking, not necessarily \( A_p \) weight function \( w_\alpha \).

Morrey spaces \( L^{p,\lambda} \) were introduced in 1938 by C. Morrey [21] in relation to regularity problems of solutions to PDEs, and provided a useful tool in the regularity theory of PDEs.

2. Main Results

Now we formulate the main results of this note:

**Theorem 2.1.** Let \( 1 \leq p_0 < \infty, x_0 \) be a point in \( X \). Suppose that \( \mathcal{F} \) is a family of non-negative pairs of functions on \( X \). Assume that for all \( (f, g) \in \mathcal{F} \) and every \( w \in A_{p_0}(X) \),

\[
\|g\|_{L^p_w(X)} \leq C_0 \|f\|_{L^p_w(X)}, \quad (f, g) \in \mathcal{F},
\]

for some \( 1 \leq p_0 < \infty \) and every \( w \in A_{p_0}(X) \), where \( C_0 \) is a positive constant independent of \( (f, g) \) and \( w \), and \( \cdot \mapsto C(\cdot) \) is a non-decreasing mapping, then for all \( 1 < p < \infty \) and \( w \in A_p(X) \), depending only on \([w]_{A_p}(X)\). Then

(a) for every \( 1 < p < \infty, \theta > 0 \), and \( w \in A_p(X) \cap RH_\eta \), we have

\[
\|g\|_{L^{p,\lambda,\theta}_w(\sigma,X)} \leq C_0 \|f\|_{L^{p,\lambda,\theta}_w(\sigma,X)}, \quad (f, g) \in \mathcal{F},
\]

where, \( w_\alpha(x) := w(x) d(x_0, x)^\alpha, \ 0 \leq \lambda < 1/\eta', \ 0 \leq \alpha < \lambda N \), and \( \sigma \) is sufficiently small positive constant depending on parameters of the space;

(b) for every \( 1 < p < \infty \) and \( \theta > 0 \), inequality \((*)\) holds, where \( w_\alpha(x) = d(x_0, x)^\alpha \) with \( N(\lambda - 1) < \alpha < N(\lambda - 1) \), and \( \sigma \) is sufficiently small positive constant depending on parameters of the space;

(c) for every \( 1 < p < \infty, \theta > 0 \), and \( w_\alpha(x) = d(x_0, x)^\alpha \) with \( N(\lambda - 1) < \alpha < N(\lambda + p - 1) \), we have

\[
\|g\|_{L^{p,\lambda,\theta}_w(X)} \leq C_0 \|f\|_{L^{p,\lambda,\theta}_w(X)}, \quad (f, g) \in \mathcal{F}.
\]

This statement enables us to formulate the boundedness results for operators of Harmonic Analysis such as maximal and Calderón–Zygmund singular operators; commutators of singular integrals; fractional integrals, etc.

Let \( K \) be the Calderón–Zygmund operator on \( X \) given by the formula

\[
(Kf)(x) = \lim_{\varepsilon \to 0} \int_{X \setminus B(x, \varepsilon)} k(x, y) f(y) d\mu(y), \quad x \in X,
\]

where \( k(x, y) \) is the Calderón–Zygmund kernel on \( X \times X \) (see e.g., [1,16] for the definition).

Denote by \( D(X) \) the class of all bounded functions on \( X \).

Let us define the class of bounded mean oscillation functions \( BMO(X) \). This is the set of all real-valued locally integrable functions on \( X \) such that

\[
\|f\|_{BMO} = \sup_{x \in X} \frac{1}{\mu B(x, r)} \int_{B(x, r)} |f(y) - f_{B(x, r)}| d\mu(y) < \infty,
\]

where \( f_{B(x, r)} \) is the integral average over the ball \( B(x, r) \). \( BMO(X) \) is a Banach space with respect to the norm \( \| \cdot \|_{BMO} \) when we regard the space \( BMO(X) \) as the class of equivalent functions modulo additive constants.
Let $U$ be an operator and $b$ a locally integrable function. We define the commutator $U_b f$ as

$$U_b f = bU(f) - U(bf).$$

Further, for $b \in BMO(X)$, let $K_b^m f(x) = \left( \int_X (b(x) - b(y))^m k(x, y) f(y) d\mu(y) \right)^m$, $m = 0, 1, 2, \ldots$, be $m$-th order commutator of singular integral, where $k(x, y)$ is the Calderón–Zygmund kernel. It is clear that $K_b^0 f$ is the CZ singular operator.

One-weight inequalities for commutators of singular integrals defined in the classical Lebesgue spaces $L^p(X)$ were established in [23].

**Theorem 2.2.** Let $1 < p < \infty$ and let $x_0$ be a point in $X$. Suppose that $\theta > 0$ and that $w \in A_p(X) \cap RH_{\eta'}$, $0 \leq \alpha < \lambda N$. We set $w_\alpha(x) := w(x)d(x_0, x)^\alpha$. Then

(a) the maximal operator $M$ is bounded in $L^{p, \lambda, \theta}_{\alpha}(\sigma, X)$ for some small positive constant $\sigma$;

(b) there is a positive constant $C$ such that for all $f \in \mathcal{D}(X)$,

$$\|Kf\|_{L^{p, \lambda, \theta}_{\alpha}(\sigma, X)} \leq C\|f\|_{L^{p, \lambda, \theta}_{\alpha}(\sigma, X)}$$

for some small positive constant $\sigma$;

(c) if $b \in BMO(X)$, then there is a positive constant $C$ such that for all $f \in \mathcal{D}(X)$,

$$\|K_b f\|_{L^{p, \lambda, \theta}_{\alpha}(\sigma, X)} \leq C\|b\|_{BMO}\|f\|_{L^{p, \lambda, \theta}_{\alpha}(\sigma, X)}$$

for some small positive constant $\sigma$;

(d) if $b \in BMO(X)$, then there is a positive constant $C$ such that for all $f \in \mathcal{D}(X)$,

$$\|K_b^m f\|_{L^{p, \lambda, \theta}_{\alpha}(\sigma, X)} \leq C\|b\|_{BMO}^m\|M^{m+1}f\|_{L^{p, \lambda, \theta}_{\alpha}(\sigma, X)},$$

for some small positive constant $\sigma$, where $M^{m+1}$ is $m + 1$-th iterated maximal operator.

Further, for power-type weights we have:

**Theorem 2.3.** Let $1 < p < \infty$ and let $x_0$ be a point in $X$. Suppose that $\theta > 0$ and $N(\lambda - 1) < \beta < N(\lambda + p - 1)$. Then the following statements hold:

(a) the maximal operator $M$ is bounded in $L^{p, \lambda, \theta}_{d(x_0, x)^\beta}(X)$;

(b) there is a positive constant $C$ such that for all $f \in \mathcal{D}(X)$,

$$\|Kf\|_{L^{p, \lambda, \theta}_{d(x_0, x)^\beta}(X)} \leq C\|f\|_{L^{p, \lambda, \theta}_{d(x_0, x)^\beta}(X)}$$

(c) if $b \in BMO(X)$, then there is a positive constant $C$ such that for all $f \in \mathcal{D}(X)$,

$$\|K_b f\|_{L^{p, \lambda, \theta}_{d(x_0, x)^\beta}(X)} \leq C\|b\|_{BMO}\|f\|_{L^{p, \lambda, \theta}_{d(x_0, x)^\beta}(X)}$$

(d) if $b \in BMO(X)$, then there is a positive constant $C$ such that for all $f \in \mathcal{D}(X)$,

$$\|K_b^m f\|_{L^{p, \lambda, \theta}_{d(x_0, x)^\beta}(X)} \leq C\|b\|_{BMO}^m\|M^{m+1}f\|_{L^{p, \lambda, \theta}_{d(x_0, x)^\beta}(X)},$$

where $M^{m+1}$ is the $m + 1$-th iterated maximal operator.

Necessary conditions for maximal operators and Hilbert transform are also obtained. Finally we mention that appropriate results for commutators of fractional integrals operators are derived.
